

Syncope Workup in Trauma

Syncope workup for trauma

If the patient is without injury – the necessity of syncopal workup is left to the discretion of the ED and Medicine teams.

1. If the patient is admitted with injury after a fall, syncope workup will start with:
 1. Troponin
 2. EKG
 3. The necessity of further workup will be directed based on medical necessity.

For patients suffering from recurrent falls that raises the concern for underlying medical reasons for falls, then proceed with further syncopal workup in conjunction with the Geriatrics Service.
