

## CT Solution

- Blunt trauma patients with concern for hemodynamic instability/hypotension
  - Dual-phase CT examinations with an arterial phase triggered off the aorta, followed by generic non-triggered time-delay (40-60s) at the portal venous phase, which would provide sufficient data for blunt trauma patients who may qualify.
- This order can be entered at “CT Angio Abd/Pelvis W+/or WO+ Recon” and specify in the order comments “Blunt trauma, dual phase, arterial + delay.”
